## A Complete Analytical Approach for Designing Efficient Microwave FET and Bipolar Oscillators

For large-signal operation of oscillators, it is necessary to obtain the exact nonlinear device parameters of the active two-port network and calculate the external feedback elements for the circuit [1]-[13]. The circuit diagram for an oscillator below shows the intrinsic transistor, its parasitic and the external feedback circuit. The semiconductor depletion layer capacitances $\left(C_{g s}, C_{g d}\right.$ and $\left.C_{g s}\right)$ and the transconductance $g_{m}$ are nonlinear, that is a function of voltage and current. The transistor in an oscillator is best described with the non-linear Materka model [2]-[6]. When using this model, the feedback element values are initially unknown. There is no good or efficient experimental solution for finding these feedback element values, only a small-signal approach [7], which does not handle power and noise.

Figure 1 Series feedback topology.

## Series Feedback (MESFET):

The best way to calculate series or parallel feedback oscillators with external elements is to use an analytical approach of designing a microwave oscillator that determines the explicit expression for the optimum feedback elements and the load impedance in terms of the transistor equivalent circuit parameters. These equations also provide a better understanding of the fundamental limitation in obtaining high output power for a given topology of the microwave oscillator [9]-[12].

Furthermore, maximizing the oscillator output power and the oscillator efficiency is the interest of many ongoing applications such as active phase-array antenna, etc.

Figure 1 shows the series feedback topology of the oscillator using a MESFET. External feedback elements $Z_{1}, Z_{2}$, and $Z_{3}$ are shown outside the dotted line.

The optimum values of the feedback element $Z_{1}, Z_{2}$, and $Z_{3}$ are given as

$$
\begin{align*}
& Z_{1}^{\text {opt }}=R_{1}^{*}+j X_{1}^{*}  \tag{1}\\
& Z_{2}^{\text {opt }}=R_{2}^{*}+j X_{2}^{*}  \tag{2}\\
& Z_{3}^{\text {opt }}=Z_{L}^{\text {opt }}=R_{3}^{*}+j X_{3}^{*}  \tag{3}\\
& Z_{\text {out }}^{\text {opt }}+Z_{L}^{\text {opt }} \Rightarrow 0  \tag{4}\\
& Z_{\text {out }}^{\text {opt }}=R_{\text {out }}^{*}+j X_{\text {out }}^{*} \tag{5}
\end{align*}
$$

The general approach for designing an oscillator corresponding to the maximum output power at a given frequency is based on the optimum values of the feedback element and the load under steady-state large signal operation. The steady-state oscillation condition for a series feedback configuration can be expressed as

$$
\begin{equation*}
\left[Z_{\text {out }}\left(I_{0}, \omega_{0}\right)+Z_{L}\left(\omega_{0}\right)\right]_{w=w_{0}}=0 \tag{6}
\end{equation*}
$$

$I_{0}$ is amplitude of the load current and $w_{0}$ is the oscillator frequency. Assuming that the steady state current entering the active circuit is near sinusoidal, medium to high Q case, the output impedance $Z_{\text {out }}\left(I_{0}, \omega_{0}\right)$ and the load impedance $Z_{L}\left(\omega_{0}\right)$ can be expressed in terms of real and imaginary part as

$$
\begin{gather*}
Z_{\text {out }}\left(I_{0}, \omega_{0}\right)=R_{\text {out }}\left(I_{0}, \omega_{0}\right)+j X_{\text {out }}\left(I_{0}, \omega_{0}\right)  \tag{7}\\
Z_{L}(\omega)=R_{L}(\omega)+j X_{L}(\omega) \tag{8}
\end{gather*}
$$

$Z_{\text {out }}\left(I_{0}, \omega_{0}\right)$ is the current-amplitude and the frequency dependent-function, and $Z_{L}(w)$ is a function of the frequency.

The common source [ $Z$ ] parameter of the MESFET is given as

$$
[Z]_{c s}=\left[\begin{array}{ll}
Z_{11} & Z_{12}  \tag{9}\\
Z_{21} & Z_{22}
\end{array}\right]_{c s}
$$

with

$$
\begin{equation*}
Z_{11}=R_{11}+j X_{11} \tag{10}
\end{equation*}
$$

$$
\begin{equation*}
R_{11}=R_{g s}\left[\frac{a}{\left(a^{2}+b^{2}\right)}+\frac{b \omega R_{d s} C_{d s}\left(1+C_{g d} / C_{d s}\right)}{\left(a^{2}+b^{2}\right)}\right]+\left[\frac{a \omega R_{d s} C_{d s}\left(1+C_{g d} / C_{d s}\right)}{\omega C_{g s}\left(a^{2}+b^{2}\right)}-\frac{b}{\omega C_{g s}\left(a^{2}+b^{2}\right)}\right] \tag{11}
\end{equation*}
$$

$$
\begin{equation*}
X_{11}=R_{g s}\left[\frac{a \omega R_{d s} C_{d s}\left(1+C_{g d} / C_{d s}\right)}{\left(a^{2}+b^{2}\right)}-\frac{b}{\left(a^{2}+b^{2}\right)}\right]-\left[\frac{a}{\omega C_{g s}\left(a^{2}+b^{2}\right)}+\frac{b \omega R_{d s} C_{d s}\left(1+C_{g d} / C_{d s}\right)}{\omega C_{g s}\left(a^{2}+b^{2}\right)}\right] \tag{12}
\end{equation*}
$$

$$
\begin{equation*}
Z_{12}=R_{12}+j X_{12} \tag{13}
\end{equation*}
$$

$$
\begin{equation*}
R_{12}=\frac{a R_{d s} C_{g d}}{C_{g s}\left(a^{2}+b^{2}\right)}+\frac{b \omega R_{d s} C_{g d} R_{g s}}{\left(a^{2}+b^{2}\right)} \tag{14}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{X}_{12}=\frac{\mathrm{a} \omega \mathrm{R}_{\mathrm{ds}} \mathrm{C}_{\mathrm{gd}} \mathrm{R}_{\mathrm{gs}}}{\left(\mathrm{a}^{2}+\mathrm{b}^{2}\right)}-\frac{\mathrm{bR}_{\mathrm{ds}} \mathrm{C}_{\mathrm{gd}}}{\mathrm{C}_{\mathrm{gs}}\left(\mathrm{a}^{2}+\mathrm{b}^{2}\right)} \tag{15}
\end{equation*}
$$

$$
\begin{equation*}
Z_{21}=R_{21}+j X_{21} \tag{16}
\end{equation*}
$$

$$
\begin{align*}
& R_{21}=R_{d s}\left[\frac{C_{g d}}{C_{g s}} \frac{a}{\left(a^{2}+b^{2}\right)}+\frac{b \omega R_{g s} C_{g d}}{\left(a^{2}+b^{2}\right)}+\frac{g_{m}(b \cos \omega \tau+a \sin \omega \tau)}{\omega C_{g s}\left(a^{2}+b^{2}\right)}\right]  \tag{17}\\
& X_{21}=R_{d s}\left[\frac{a \omega R_{g s} C_{g d}}{\left(a^{2}+b^{2}\right)}-\frac{C_{g d}}{C_{g s}} \frac{b}{\left(a^{2}+b^{2}\right)}+\frac{g_{m}(a \cos \omega \tau-b \sin \omega \tau)}{\omega C_{g s}\left(a^{2}+b^{2}\right)}\right] \tag{18}
\end{align*}
$$

$$
\begin{equation*}
Z_{22}=R_{22}+j X_{22} \tag{19}
\end{equation*}
$$

$$
\begin{equation*}
R_{22}=R_{d s}\left[\frac{a}{\left(a^{2}+b^{2}\right)}+\frac{C_{g d}}{C_{g s}} \frac{a}{\left(a^{2}+b^{2}\right)}+\frac{b}{\left(a^{2}+b^{2}\right)} \omega R_{g s} C_{g d}\right] \tag{20}
\end{equation*}
$$

$$
\begin{equation*}
X_{22}=R_{d s}\left[\frac{a \omega R_{g s} C_{g d}}{\left(a^{2}+b^{2}\right)}-\frac{C_{g d}}{C_{g s}} \frac{b}{\left(a^{2}+b^{2}\right)}-\frac{b}{\left(a^{2}+b^{2}\right)}\right] \tag{21}
\end{equation*}
$$

with

$$
\begin{gather*}
a=1+\frac{C_{g d}}{C_{g s}}\left(1-\omega^{2} R_{g s} C_{g s} R_{d s} C_{d s}\right)+\frac{g_{m} R_{d s} C_{g d}}{C_{g s}} \cos (\omega \tau)  \tag{22}\\
b=\omega\left(R_{d s} C_{d s}+R_{d s} C_{g d}\right)+\omega \frac{C_{g d}}{C_{g s}}\left(R_{g s} C_{g s}+R_{d s} C_{d s}\right)-\frac{g_{m} R_{d s} C_{g d}}{C_{g s}} \sin (\omega \tau) \tag{23}
\end{gather*}
$$

The expression of the output impedance, $Z_{\text {out }}$ can be written as

$$
\begin{gather*}
Z_{\text {out }}=\left[\left[Z_{22}+Z_{2}\right]-\frac{\left[Z_{12}+Z_{2}\right]\left[Z_{21}+Z_{2}\right]}{\left[Z_{11}+Z_{1}+Z_{2}\right]}\right]  \tag{24}\\
Z_{\text {out }}+Z_{3} \Rightarrow Z_{\text {out }}+Z_{L}=0 \tag{25}
\end{gather*}
$$

where $Z_{i j}(\mathrm{i}, \mathrm{j}=1,2)$ is the $Z$-parameters of the transistor model and can be expressed as

$$
\begin{equation*}
\left\lfloor Z_{i, j}\right\rfloor_{i, j=1,2}=\left[R_{i j}+j X_{i j}\right]_{i, j=1,2} \tag{26}
\end{equation*}
$$

According to the criterion for the maximum output power at a given oscillator frequency, the negative real part of the output impedance $\mathrm{Z}_{\text {out }}$ has to be maximized, and the optimal values of the feedback reactance under which the negative value of $\mathrm{R}_{\text {out }}$ is maximized is given by the following condition as [2]:

$$
\begin{align*}
& \frac{\partial \operatorname{Re}}{\partial X_{1}}\left[Z_{\text {out }}(I, \omega)\right]=0 \Rightarrow \frac{\partial}{\partial X_{1}}\left[R_{\text {out }}\right]=0  \tag{27}\\
& \frac{\partial \operatorname{Re}}{\partial X_{2}}\left[Z_{\text {out }}(I, \omega)\right]=0 \Rightarrow \frac{\partial}{\partial X_{2}}\left[R_{\text {out }}\right]=0 \tag{28}
\end{align*}
$$

The values of $X_{1}$ and $X_{2}$, which will satisfy the differential equations above are given as $\mathrm{X}_{1}^{*}$ and $\mathrm{X}_{2}^{*}$. These can be expressed in terms of a two-port parameter of the active device (MESFET) as:

$$
\begin{gather*}
X_{1}^{*}=-X_{11}+\left[\frac{X_{12}+X_{21}}{2}\right]+\left[\frac{R_{21}-R_{12}}{X_{21}-X_{12}}\right]\left[\frac{R_{12}+R_{21}}{2}-R_{11}-R_{1}\right]  \tag{29}\\
X_{1}^{*}=\frac{\left(1-\omega \tau_{g} \tan \omega \tau\right)}{\omega C_{g s}(a-b \tan \omega \tau)}-\frac{(b+a \tan \omega \tau)\left(R_{1}+R_{g}\right)}{(a-b \tan \omega \tau)}-\left[\frac{R_{d s} C_{d s}\left(\omega \tau_{g}+\tan \omega \tau\right)}{C_{g s}(a-b \tan \omega \tau)}-\frac{g_{m} R_{d s}}{2 \omega C_{g s} \cos \omega \tau(a-b \tan \omega \tau)}\right] \tag{30}
\end{gather*}
$$

where $\tau$ is the transit time in the MESFET-channel and $\tau_{g}=C_{g s} R_{g s}$ and $\tau_{d}=C_{d s} R_{d s}$.

$$
\begin{gather*}
X_{2}^{*}=-\left[\frac{X_{12}+X_{21}}{2}\right]-\left[\frac{\left(R_{21}-R_{12}\right)\left(2 R_{2}+R_{12}+R_{21}\right)}{2\left(X_{21}-X_{12}\right)}\right]  \tag{31}\\
X_{2}^{*}=\frac{R_{d s} C_{g d}\left(\omega \tau_{g}+\tan \omega \tau\right)}{C_{g s}(a-b \tan \omega \tau)}-\frac{(b+a \tan \omega \tau)\left(R_{2}+R_{s}\right)}{(a-b \tan \omega \tau)}-\frac{g_{m} R_{d s}}{(a-b \tan \omega \tau) 2 \omega C_{g s} \cos \omega \tau} \tag{32}
\end{gather*}
$$

$\left\lfloor R_{i, j}\right\rfloor_{i, j=1,2}$ and $=\left[X_{i j}\right]_{i, j=1,2}$ are the real and imaginary parts of the $\left[Z_{i, j}\right]_{i, j=1,2}$ of the transistor.

The output impedance can be given as $Z_{\text {out }}(I, \omega)=R_{\text {out }}(I, \omega)+X_{\text {out }}(I, \omega)$ and the corresponding optimum output impedance for the given oscillator frequency can be derived analytically by substituting values of the optimum values of susceptance under which negative value of $R_{\text {out }}$ is

$$
\begin{gather*}
{\left[Z_{\text {out }}^{*}(I, \omega)\right]_{\omega-\omega_{0}}=\left[R_{\text {out }}^{*}(I, \omega)+X_{\text {out }}^{*}(I, \omega)\right]_{\omega=\omega_{0}}}  \tag{33}\\
{\left[R_{\text {out }}^{*}\left(I, \omega_{0}\right)\right]_{X_{1}^{*}, X_{2}^{*}}=\left\{R_{2}+R_{22}-\left[\frac{\left(2 R_{2}+R_{21}+R_{12}\right)^{2}+\left(X_{21}-X_{12}\right)^{2}}{4\left(R_{11}+R_{2}+R_{1}\right)}\right]\right\}}  \tag{34}\\
{[(I, \omega)]=\left\{\frac{X_{22}-X_{12}-X_{21}}{2}-\frac{\left(R_{21}-R_{12}\right)\left(2 R_{2}+R_{12}+R_{21}\right)}{2\left(X_{21}-X_{12}\right)}-\frac{\left(R_{21}-R_{12}\right)\left(R_{\text {out }}^{*}-R_{2}-R_{22}\right)}{X_{21}-X_{12}}\right\}} \\
{\left[X_{\text {out }}^{*}(I, \omega)\right]_{x_{1}^{*}, X_{2}^{*}}=X_{2}^{*}+X_{22}-\left[\frac{R_{21}-R_{12}}{X_{21}-X_{12}}\right]\left[R_{\text {out }}^{*}-R_{2}-R_{22}\right]}  \tag{35}\\
X_{\text {out }}^{*}=\frac{R_{d s}}{(a-b \tan \omega \tau)}\left[\tan \omega \tau-\frac{g_{m}}{2 w C_{g s} \cos \omega \tau}\right]-\frac{(b+a \tan \omega \tau) R_{\text {out }}^{*}}{(a-b \tan \omega \tau)} \tag{37}
\end{gather*}
$$

$X_{1}^{*}$ and $X_{2}^{*}$ in the equations above are the optimal values of the external feedback susceptance.

For easier analysis, the effects of the transit time and the gate-drain capacitance are neglected for preliminary calculation of an optimum value of the feedback element and the simplified expressions are given as

$$
\begin{equation*}
X_{1}^{*}=\frac{1}{\omega C_{g s}}+R_{d s}\left[-\omega C_{d s}\left(R_{1}+R_{g}+R_{g s}\right)+\frac{g_{m}}{2 \omega C_{g s}}\right] \tag{38}
\end{equation*}
$$

$$
\begin{gather*}
X_{2}^{*}=-R_{d s}\left[\omega C_{d s}\left(R_{2}+R_{s}\right)+\frac{g_{m}}{2 \omega C_{g s}}\right]  \tag{39}\\
X_{\text {out }}^{*}=-R_{d s}\left[\omega C_{d s} R_{\text {out }}^{*}+\frac{g_{m}}{2 \omega C_{g s}}\right]  \tag{40}\\
R_{\text {out }}^{*}=\left(R_{2}+R_{s}\right)+\frac{R_{d s}}{1+\left(\omega C_{d s} R_{d s}\right)^{2}}\left[1-\frac{R_{d s}}{R_{g}+R_{s}+R_{1}+R_{2}+R_{g s}}\left(\frac{g_{m}}{2 \omega C_{g s}}\right)^{2}\right] \tag{41}
\end{gather*}
$$

The simplified expressions above show accuracy with the harmonic balance-based simulated results for a gate length less than $1 \mu \mathrm{~m}$ at an operating frequency range up to 20 GHz.

The differential drain resistance $R_{\mathrm{ds}}$ can be expressed in terms of the optimum output resistance as

$$
\begin{equation*}
R_{d s}=\frac{\left(1+\sqrt{1-4\left(R_{\text {out }}^{*}-R_{2}-R_{s}\right) G_{d s o}}\right)}{2 G_{d s o}} \tag{42}
\end{equation*}
$$

where

$$
\begin{equation*}
G_{d s o}=\frac{1}{R_{g}+R_{s}+R_{2}+R_{g s}}\left(\frac{g_{m}}{2 \omega C_{g s}}\right)^{2}+\left(R_{\text {out }}^{*}-R_{2}-R_{s}\right)\left(\omega C_{d s}\right)^{2} \tag{43}
\end{equation*}
$$

Alternatively, a differential drain resistance can be obtained from a quasi-linear analysis. Under large signal operation, the transistor parameters vary with the drive level. If we restrict our interest to the fundamental signal frequency component, then $V_{g s}$ and $V_{d s}$ can be expressed as

$$
\begin{align*}
& V_{g s}(t)=V_{g s o}+V_{g s} \operatorname{Sin}(\omega t+\varphi)  \tag{44}\\
& V_{d s}(t)=V_{d s o}+V_{d s} \operatorname{Sin}(\omega t) \tag{45}
\end{align*}
$$

$V_{g s o}$ and $V_{d s o}$ are the DC operating bias voltages, $V_{g s}$ and $V_{d s}$ are the amplitude of the signal frequency components, and $\varphi$ is the phase difference between the gate and drain voltages.

The drain current $I_{d}$ can be expressed as

$$
\begin{equation*}
I_{d s}=I_{d s}\left(V_{g s}, V_{d s o}\right) \tag{46}
\end{equation*}
$$

Under the assumption of linear superposition of the DC and RF currents, an instantaneous drain current can be expressed as

$$
\begin{equation*}
I_{d s}(t)=I_{d s o}+g_{m} v_{g s} \cos (\omega t+\varphi)+G_{d} v_{d s} \cos (\omega t) \tag{47}
\end{equation*}
$$

where $I_{d s o}$ is the DC bias drain current.
The transconductance $g_{m}$ and the drain conductance are defined as

$$
\begin{align*}
& g_{m}=\left[\frac{I_{d s}}{V_{g s}}\right]_{V_{d s=0}}  \tag{48}\\
& G_{D}=\left[\frac{I_{d s}}{V_{g s}}\right]_{V_{g s=0}} \tag{49}
\end{align*}
$$

Under large signal conditions, the transconductance and the drain conductance are given as

$$
\begin{align*}
& g_{m}=\frac{\omega}{\pi V_{g s} \sin \varphi} \int_{0}^{\frac{2 \pi}{\omega}} I_{d s} \sin (\omega t) d t  \tag{50}\\
& G_{d}=\frac{\omega}{\pi V_{d s} \sin \varphi} \int_{0}^{\frac{2 \pi}{\omega}} I_{d s} \sin (\omega t+\varphi) d t \tag{51}
\end{align*}
$$

The drain current can be expressed in terms of $V_{g s}, V_{p}$ and $V_{d s}$ as

$$
\begin{gather*}
I_{d}=I_{d s s}\left[1-\frac{V_{g}}{V_{p}}\right]^{2} \tanh \left[\frac{\alpha V_{d}}{V_{g}-V_{p}}\right]  \tag{52}\\
V_{p}=V_{p 0}+\gamma V_{d} \tag{53}
\end{gather*}
$$

$I_{d s s}$ is the saturation current and $V_{p}$ is the gate pinch-off voltage, $\alpha, \gamma$ and $V_{p 0}$ are the model parameters of the MESFET.

Applying a Taylor-series expansion of the equation about the DC operating point and considering the fundamental frequency component terms, the large signal drain resistance, as function of the small signal drain voltage amplitude, can be given as

$$
\begin{equation*}
\left.R_{D S}\right|_{L \text { arge-signal }}=\frac{R_{d s}}{\left(1+A V_{d}^{2}\right)} \tag{54}
\end{equation*}
$$

where $R_{D S}$ and $R_{d s}$ are the large and signal differential resistances.

A is defined as

$$
\begin{align*}
& A=\left\{\frac{3 \tanh ^{2}\left[\frac{\alpha V_{d 0}}{V_{g 0}-V_{p}}\right]-1}{4\left[\frac{V_{g 0}-V_{p}}{\alpha}\right]^{2}}\right\}  \tag{55}\\
& R_{d s}=\left\{\frac{\cosh ^{2}\left[\frac{\alpha V_{d 0}}{V_{g 0}-V_{p}}\right]}{I_{d s s}\left[1-\frac{V_{g 0}}{V_{p}}\right]^{2}}\left[\frac{V_{g 0}-V_{p}}{\alpha}\right]\right\} \tag{56}
\end{align*}
$$

From the expression above, $\left.R_{D S}\right|_{\text {Large-signal }}$ has a maximum value in the absence of the RF drive signal and gets smaller as the amplitude of the RF signal increases. Consequently, the oscillator output impedance and the oscillator output power are a function of the change of the drain resistance under large-signal operation. To support the steady-state operation mode, the amplitude and the phase balance conditions can be written as

$$
\begin{align*}
& {\left[R_{\text {out }}^{*}(I, \omega)+R_{L}(\omega)\right]_{\omega=\omega_{0}}=0}  \tag{57}\\
& {\left[X_{\text {out }}^{*}(I, \omega)+X_{L}^{*}(\omega)=0\right]_{\omega=\omega_{0}}=0} \tag{58}
\end{align*}
$$

The output power of the oscillator can be expressed in terms of load current and load impedance as

$$
\begin{equation*}
P_{\text {out }}=\frac{1}{2} I_{\text {out }}^{2} \operatorname{Re}\left[Z_{L}\right] \tag{59}
\end{equation*}
$$

where $I_{\text {out }}$ and $V_{\text {out }}$ are the corresponding load current and drain voltage across the output.

$$
\begin{equation*}
I_{\text {out }}=\left[\frac{Z_{11}+Z_{1}+Z_{2}}{Z_{22}\left(Z_{11}+Z_{1}+Z_{2}\right)-Z_{21}\left(Z_{12}+Z_{2}\right)}\right] V_{\text {out }} \tag{60}
\end{equation*}
$$

$$
\begin{equation*}
P_{\text {out }}=\frac{1}{2} I_{\text {out }}^{2} \operatorname{Re}\left[Z_{L}\right] \Rightarrow \frac{1+\left(\frac{R_{21}-R_{12}}{X_{21}-X_{12}}\right)^{2}}{\left(R_{22}+R\right)^{2}+\left(X_{22}+X\right)^{2}}\left(R_{\text {out }}+R_{d}\right) \frac{V_{d}^{2}}{2} \tag{61}
\end{equation*}
$$

where

$$
\begin{align*}
& R=\frac{X_{21}\left(X_{12}+X_{2}^{*}\right)-R_{21}\left(R_{12}+R_{2}+R_{s}\right)-X_{22}\left(X_{11}+X_{1}^{*}+X_{2}^{*}\right)}{R_{11}+R_{1}+R_{2}+R_{g}+R_{s}}  \tag{62}\\
& X=\frac{R_{21}\left(X_{11}+X_{1}^{*}+X_{2}^{*}\right)-R_{21}\left(X_{12}+X_{2}^{*}\right)-X_{21}\left(R_{12}+R_{2}+R_{s}\right)}{R_{11}+R_{1}+R_{2}+R_{g}+R_{s}} \tag{63}
\end{align*}
$$

## Parallel Feedback (MESFET):

Figure 2 shows the parallel feedback topology of the oscillator using the MESFET, in which the external feedback elements $Y_{1}, Y_{2}$, and $Y_{3}$ are shown outside the dotted line.

Figure 2 Parallel feedback topology.

The optimum values of the feedback element $Y_{1,} Y_{2}$ and $Y_{3}$ are given as

$$
\begin{align*}
& Y_{1}^{\text {opt }}=G_{1}^{*}+j B_{1}^{*}  \tag{64}\\
& Y_{2}^{\text {opt }}=G_{2}^{*}+j B_{2}^{*} \tag{65}
\end{align*}
$$

$$
\begin{align*}
& Y_{3}^{\text {opt }}=Y_{L}^{\text {opt }}=G_{3}^{*}+j B_{3}^{*}  \tag{66}\\
& Y_{\text {out }}^{\text {opt }}+Y_{L}^{\text {opt }} \Rightarrow 0  \tag{67}\\
& Y_{\text {out }}^{\text {opt }}=G_{\text {out }}^{*}+j B_{\text {out }}^{*} \tag{68}
\end{align*}
$$

The common source [ $Y$ ] parameter of the MESFET is given as

$$
\begin{gather*}
{[Y]_{c s}=\left[\begin{array}{ll}
Y_{11} & Y_{12} \\
Y_{21} & Y_{22}
\end{array}\right]}  \tag{69}\\
Y_{11}=\frac{j \omega C_{g s}}{1+j \omega C_{g s} R_{g s}}+j \omega C_{g d} \Rightarrow G_{11}+j B_{11}  \tag{70}\\
Y_{21}=\frac{g_{m} \exp (-j \omega \tau)}{1+j \omega C_{g s} R_{g s}}-j \omega C_{g d} \Rightarrow G_{21}+j B_{21}  \tag{71}\\
Y_{12}=-j \omega C_{g d} \Rightarrow G_{12}+j B_{12}  \tag{72}\\
Y_{22}=\frac{1}{R_{d s}}+j \omega\left(C_{d s}+C_{g d}\right) \Rightarrow G_{22}+j B_{22} \tag{73}
\end{gather*}
$$

The optimum values of the output admittance $Y_{\text {out }}^{*}$ and the feedback susceptance $B_{1}^{*}$ and $B_{2}^{*}$, which can be expressed in terms of the two-port $Y$-parameter of the active device given as

$$
\begin{gather*}
B_{1}^{*}=-\left\{B_{11}+\left[\frac{B_{12}+B_{21}}{2}\right]+\left[\frac{G_{21}-G_{12}}{B_{21}-B_{12}}\right]\left[\frac{G_{12}+G_{21}}{2}+G_{11}\right]\right\}  \tag{74}\\
B_{1}^{*}=\frac{g_{m}}{2 \omega C_{g s} R_{g s}}  \tag{75}\\
B_{2}^{*}=\left[\frac{B_{12}+B_{21}}{2}\right]+\left[\frac{\left(G_{12}+G_{21}\right)\left(G_{21}-G_{12}\right)}{2\left(B_{21}-B_{12}\right)}\right] \tag{76}
\end{gather*}
$$

$$
\begin{equation*}
B_{2}^{*}=-\omega C_{d g}-\frac{g_{m}}{2 \omega C_{g s} R_{g s}} \tag{77}
\end{equation*}
$$

The optimum values of the real and imaginary part of the output admittance as

$$
\begin{equation*}
Y_{\text {out }}^{*}=\left[G_{\text {out }}^{*}+j B_{\text {out }}^{*}\right] \tag{78}
\end{equation*}
$$

where $G_{\text {out }}{ }^{*}$ and $B_{\text {out }}{ }^{*}$ is given as

$$
\begin{gather*}
G_{\text {out }}^{*}=G_{22}-\left[\frac{\left(G_{12}+G_{21}\right)^{2}\left(B_{21}-B_{12}\right)^{2}}{4 G_{11}}\right]  \tag{79}\\
G_{\text {out }}^{*}=\frac{1}{R_{d s}}-\frac{1}{R_{g s}}\left[\frac{g_{m}}{2 \omega C_{g s}}\right]^{2}  \tag{80}\\
B_{\text {out }}^{*}=B_{22}+\left[\frac{G_{21}-G_{12}}{B_{21}-B_{12}}\right]-\left[\frac{\left(G_{12}+G_{21}\right)}{2}+G_{22}-G_{\text {out }}^{*}\right]+\left[\frac{B_{21}+B_{12}}{2}\right]  \tag{81}\\
B_{\text {out }}^{*}=\omega C_{g d}-\frac{1}{R_{g s}}\left[\frac{g_{m}}{2 \omega C_{g s}}\right]\left[1-\frac{1}{R_{g s}} \frac{1}{\omega C_{g s}} \frac{g_{m}}{2 \omega C_{g s}}\right] \tag{82}
\end{gather*}
$$

The value of the output susceptance $B_{\text {out }}{ }^{*}$ may be positive or negative, depending on the values of the transistor transconductance and $\tau_{\mathrm{gs}}=\mathrm{R}_{\mathrm{gs}} \mathrm{C}_{\mathrm{gs}}$.

The voltage feedback factor-n and phase- $\varphi_{\mathrm{n}}$ can be expressed in terms of transistor $Y$ parameters as

$$
\begin{align*}
& n\left(V_{d s} / V_{g s}\right)=\frac{\sqrt{\left(G_{12}+G_{21}-2 G_{2}\right)^{2}+\left(B_{21}-B_{12}\right)^{2}}}{2\left(G_{12}+G_{21}-G_{2}\right)} \Rightarrow \frac{1}{2} \sqrt{1+\left(\omega R_{s} C_{g s}\right)^{2}}  \tag{83}\\
& \Phi_{n}(\text { phase })=\tan ^{-1} \frac{B_{21}-B_{12}}{G_{12}+G_{21}-2 G_{2}} \Rightarrow-\tan ^{-1}\left(\omega R_{s} C_{g s}\right) \tag{84}
\end{align*}
$$

The output power of the oscillator can be expressed in terms of the load current and the load impedance as

$$
\begin{equation*}
P_{\text {out }}=\frac{1}{2} I_{\text {out }}^{2} \operatorname{Re}\left[Z_{L}\right] \tag{85}
\end{equation*}
$$

where $I_{\text {out }}$ and $V_{\text {out }}$ is the corresponding load current and drain voltage across the output.

$$
\begin{equation*}
I_{\text {out }}=\left[\frac{Z_{11}+Z_{1}+Z_{2}}{Z_{22}\left(Z_{11}+Z_{1}+Z_{2}\right)-Z_{21}\left(Z_{12}+Z_{2}\right)}\right] V_{\text {out }} \tag{86}
\end{equation*}
$$

## Series Feedback (Bipolar):

Figure 3 shows the series feedback oscillator topology for deriving explicit analytical expressions for the optimum values of the external feedback elements and the load impedance for maximum power output at a given oscillator frequency through [ $Z$ ]parameters of a bipolar transistor. The modified physics based Gummel-Poon [8, 9] models nicely describes the physical behavior of the bipolar transistor.

Figure 3 Series feedback topology of the oscillator using bipolar transistor.

Figure 3 shows the series feedback topology of the oscillator using a bipolar transistor, in which external feedback elements $Z_{1}, Z_{2}$ and $Z_{3}$ are shown outside the dotted line.

The optimum values of the feedback element $Z_{1}, Z_{2}$ and $Z_{3}$ are given as

$$
\begin{align*}
& Z_{1}^{\text {opt }}=R_{1}^{*}+j X_{1}^{*}  \tag{87}\\
& Z_{2}^{\text {opt }}=R_{2}^{*}+j X_{2}^{*}  \tag{88}\\
& Z_{3}^{\text {opt }}=Z_{L}^{\text {opt }}=R_{3}^{*}+j X_{3}^{*}  \tag{89}\\
& Z_{\text {out }}^{\text {opt }}+Z_{L}^{\text {opt }} \Rightarrow 0  \tag{90}\\
& Z_{\text {out }}^{\text {opt }}=R_{\text {out }}^{*}+j X_{\text {out }}^{*} \tag{91}
\end{align*}
$$

The [ $Z$ ] parameters of the internal bipolar transistor in a common-emitter, small signal condition are given as [2,10,11]

$$
\begin{gather*}
{[Z]_{c e}=\left[\begin{array}{ll}
Z_{11} & Z_{12} \\
Z_{21} & Z_{22}
\end{array}\right]}  \tag{92}\\
Z_{11}=R_{11}+j X_{11} \Rightarrow a\left[\frac{1}{g_{m}}+r_{b}\left(\frac{\omega}{\omega_{T}}\right)^{2}\right]-j a \frac{\omega}{\omega_{T}}\left[\frac{1}{g_{m}}-r_{b}\right]  \tag{93}\\
Z_{12}=R_{12}+j X_{12} \Rightarrow a\left[\frac{1}{g_{m}}+r_{b}\left(\frac{\omega}{\omega_{T}}\right)^{2}\right]-j a \frac{\omega}{\omega_{T}}\left[\frac{1}{g_{m}}-r_{b}\right]  \tag{94}\\
Z_{21}=R_{21}+j X_{21} \Rightarrow a\left[\frac{1}{\omega_{T} C_{c}}+\frac{1}{g_{m}}+r_{b}\left(\frac{\omega}{\omega_{T}}\right)^{2}\right]-j a \frac{\omega}{\omega_{T}}\left[\frac{1}{g_{m}}-\frac{1}{\omega_{T} C_{c}}-r_{b}\right]  \tag{95}\\
Z_{22}=R_{22}+j X_{22} \Rightarrow a\left[\frac{1}{\omega_{T} C_{c}}+\frac{1}{g_{m}}+r_{b}\left(\frac{\omega}{\omega_{T}}\right)^{2}\right]-j a \frac{\omega}{\omega_{T}}\left[\frac{1}{g_{m}}+\frac{1}{\omega_{T} C_{c}}-r_{b}\right] \tag{96}
\end{gather*}
$$

where

$$
\begin{gather*}
a=\left\{\frac{1}{1+\left[\frac{\omega}{\omega_{T}}\right]^{2}}\right\}  \tag{97}\\
\omega_{T}=2 \pi f_{T}  \tag{98}\\
f_{T}=\frac{g_{m}}{2 \pi C_{e}} \tag{99}
\end{gather*}
$$

According to the optimum criterion for the maximum power output at a given oscillator frequency, the negative real part of the output impedance $Z_{\text {out }}$ has to be maximized and the possible optimal values of the feedback reactance, under which the negative value of $R_{\text {out }}$ is maximized, is given by the following condition as [10]

$$
\begin{align*}
& \frac{\partial \operatorname{Re}}{\partial X_{1}}\left[Z_{\text {out }}(I, \omega)\right]=0 \Rightarrow \frac{\partial}{\partial X_{1}}\left[R_{\text {out }}\right]=0  \tag{100}\\
& \frac{\partial \operatorname{Re}}{\partial X_{2}}\left[Z_{\text {out }}(I, \omega)\right]=0 \Rightarrow \frac{\partial}{\partial X_{2}}\left[R_{\text {out }}\right]=0 \tag{101}
\end{align*}
$$

The values of $X_{1}$ and $X_{2}$, which will satisfy the differential equations above, are given as $X_{1}^{*}$ and $X_{2}^{*}$. This can be expressed in terms of a two-port parameter of the active device (bipolar) as [10]

$$
\begin{gather*}
X_{1}^{*}=-X_{11}+\left[\frac{X_{12}+X_{21}}{2}\right]+\left[\frac{R_{21}-R_{12}}{X_{21}-X_{12}}\right]\left[\frac{R_{12}+R_{21}}{2}-R_{11}-R_{1}\right]  \tag{102}\\
X_{1}^{*}=\frac{1}{2 \omega C_{c}}-r_{b} \frac{\omega}{\omega_{T}}  \tag{103}\\
X_{2}^{*}=-\left[\frac{X_{12}+X_{21}}{2}\right]-\left[\frac{\left(R_{21}-R_{12}\right)\left(2 R_{2}+R_{12}+R_{21}\right)}{2\left(X_{21}-X_{12}\right)}\right] \tag{104}
\end{gather*}
$$

$$
\begin{equation*}
X_{2}^{*}=-\frac{1}{2 \omega C_{c}}-\left(r_{b e}+r_{e}\right) \frac{\omega}{\omega_{T}} \tag{105}
\end{equation*}
$$

By substituting the values of $X_{1}^{*}$ and $X_{2}^{*}$ into the equation above, the optimal real and imaginary parts of the output impedance $Z_{\text {out }}^{*}$ can be expressed as

$$
\begin{gather*}
Z_{\text {out }}^{*}=R_{\text {out }}{ }^{*}+X_{\text {out }}^{*}  \tag{106}\\
R_{\text {out }}^{*}=R_{2}+R_{22}-\left[\frac{\left(2 R_{2}+R_{21}+R_{12}\right)^{2}+\left(X_{21}-X_{12}\right)^{2}}{4\left(R_{11}+R_{2}+R_{1}\right)}\right]  \tag{107}\\
R_{\text {out }}^{*}=r_{c}+\frac{r_{b}}{r_{b}+r_{e}+R_{11}}\left[r_{e}+R_{11}+\frac{a}{\omega_{T} C_{e}}\right]-\frac{a}{r_{b}+r_{e}+R_{11}}\left[\frac{1}{2 \omega C_{e}}\right]  \tag{108}\\
X_{\text {out }}^{*}=X_{2}^{*}+X_{22}-\left[\frac{R_{21}-R_{12}}{X_{21}-X_{12}}\right]\left[R_{\text {out }}^{*}-R_{2}-R_{22}\right]  \tag{109}\\
X_{\text {out }}^{*}=\frac{1}{2 \omega C_{e}}-\left(R_{\text {out }}{ }^{*}-r_{c}\right) \frac{\omega}{\omega_{T}} \tag{110}
\end{gather*}
$$

thus, in the steady-state operation mode of the oscillator, the amplitude, and the phase balance conditions can be written as

$$
\begin{align*}
& R_{\text {out }}^{*}+R_{L}=0  \tag{111}\\
& X_{\text {out }}^{*}+X_{L}^{*}=0 \tag{112}
\end{align*}
$$

The output power of the oscillator can be expressed in terms of load current and load impedance as

$$
\begin{equation*}
P_{\text {out }}=\frac{1}{2} I_{\text {out }}{ }^{2} \operatorname{Re}\left[Z_{L}\right] \tag{113}
\end{equation*}
$$

$I_{\text {out }}$ and $V_{\text {out }}$ are the corresponding load current and drain-voltage across the output.

$$
\begin{gather*}
I_{\text {out }}=\left[\frac{Z_{11}+Z_{1}+Z_{2}}{Z_{11} Z_{2}-Z_{12}\left(Z_{1}+Z_{2}\right)}\right] V_{b e}  \tag{114}\\
V_{\text {out }}=V_{c}=\left[\frac{Z_{22}\left(Z_{11}+Z_{1}+Z_{2}\right)-Z_{21}\left(Z_{2}+Z_{12}\right)}{Z_{12}\left(Z_{1}+Z_{2}\right)-Z_{11} Z_{2}}\right] V_{b e}  \tag{115}\\
P_{\text {out }}=\frac{1}{2} I_{\text {out }}^{2} \operatorname{Re}\left[Z_{L}\right]  \tag{116}\\
P_{\text {out }}=a G_{m}^{2}(x) R_{\text {out }}^{*} \frac{\left(r_{b}+r_{e}+R_{11}\right)}{\left(r_{b}+r_{c}-R_{\text {out }}^{*}\right)} \frac{V_{1}^{2}}{2} \tag{117}
\end{gather*}
$$

$V_{1}$ is the signal voltage and $x$ is the drive level across base-emitter junction of bipolar transistor. The large signal transconductance $G_{m}(x)$ is given as

$$
\begin{gather*}
G_{m}(x)=\frac{q I_{d c}}{k T x}\left[\frac{2 I_{1}(x)}{I_{0}(x)}\right]_{n=1}=\frac{g_{m}}{x}\left[\frac{2 I_{1}(x)}{I_{0}(x)}\right]_{n=1}  \tag{118}\\
\left.V_{1}\right|_{\text {peak }}=\frac{k T}{q} x  \tag{119}\\
g_{m}=\frac{I_{d c}}{k T / q} \tag{120}
\end{gather*}
$$

where $g_{m}$ is the small signal transconductance.

## Parallel Feedback (Bipolar):

Figure 4 shows the parallel feedback topology of the oscillator using a bipolar transistor in which the external feedback elements $Y_{1}, Y_{2}$, and $Y_{3}$ are shown outside the dotted line.

Figure 4 A parallel feedback topology of the oscillator using a bipolar transistor.
The optimum values of the feedback elements $Y_{1}, Y_{2}$ and $Y_{3}$ are given as

$$
\begin{align*}
& Y_{1}^{\text {opt }}=G_{1}^{*}+j B_{1}^{*}  \tag{121}\\
& Y_{2}^{\text {opt }}=G_{2}^{*}+j B_{2}^{*}  \tag{122}\\
& Y_{3}^{\text {opt }}=G_{L}^{\text {opt }}=G_{3}^{*}+j B_{3}^{*}  \tag{123}\\
& Y_{\text {out }}^{\text {opt }}+Y_{L}^{\text {opt }} \Rightarrow 0  \tag{124}\\
& Y_{\text {out }}^{\text {opt }}=G_{\text {out }}^{*}+j B_{\text {out }}^{*} \tag{125}
\end{align*}
$$

The common source [Y] parameter of the bipolar transistor is given as

$$
\begin{align*}
& {[Y]_{c s}=\left[\begin{array}{ll}
Y_{11} & Y_{12} \\
Y_{21} & Y_{22}
\end{array}\right]}  \tag{126}\\
& Y_{11}=G_{11}+j B_{11}  \tag{127}\\
& Y_{21}=G_{21}+j B_{21}  \tag{128}\\
& Y_{12}=G_{12}+j B_{12}  \tag{129}\\
& Y_{22}=G_{22}+j B_{22} \tag{130}
\end{align*}
$$

The optimum values of the output admittance $Y_{\text {out }}^{*}$ and feedback susceptance $B_{1}^{*}$ and $\mathrm{B}_{2}^{*}$, which can be expressed in terms of the two-port $Y$-parameter of the active device, is given as

$$
\begin{align*}
& B_{1}^{*}=-\left\{B_{11}+\left[\frac{B_{12}+B_{21}}{2}\right]+\left[\frac{G_{21}-G_{12}}{B_{21}-B_{12}}\right]\left[\frac{G_{12}+G_{21}}{2}+G_{11}\right]\right\}  \tag{131}\\
& B_{2}^{*}=\left[\frac{B_{12}+B_{21}}{2}\right]+\left[\frac{\left(G_{12}+G_{21}\right)\left(G_{21}-G_{12}\right)}{2\left(B_{21}-B_{12}\right)}\right] \tag{132}
\end{align*}
$$

The optimum values of the real and imaginary part of the output admittance as

$$
\begin{equation*}
Y_{\text {out }}^{*}=\left[G_{\text {out }}^{*}+j B_{\text {out }}^{*}\right] \tag{133}
\end{equation*}
$$

where $G_{\text {out }}{ }^{*}$ and $B_{\text {out }}{ }^{*}$ is given as

$$
\begin{gather*}
G_{\text {out }}^{*}=G_{22}-\left[\frac{\left(G_{12}+G_{21}\right)^{2}\left(B_{21}-B_{12}\right)^{2}}{4 G_{11}}\right]  \tag{134}\\
B_{\text {out }}^{*}=B_{22}+\left[\frac{G_{21}-G_{12}}{B_{21}-B_{12}}\right]-\left[\frac{\left(G_{12}+G_{21}\right)}{2}+G_{22}-G_{\text {out }}^{*}\right]+\left[\frac{B_{21}+B_{12}}{2}\right] \tag{135}
\end{gather*}
$$

The output power of the oscillator can be expressed in terms of the load current and the load impedance as

$$
\begin{equation*}
P_{\text {out }}=\frac{1}{2} I_{\text {out }}^{2} \operatorname{Re}\left[Z_{L}\right] \tag{136}
\end{equation*}
$$

where $I_{\text {out }}$ and $V_{\text {out }}$ is the corresponding load current and drain voltage across the output.

$$
\begin{equation*}
I_{\text {out }}=\left[\frac{Z_{11}+Z_{1}+Z_{2}}{Z_{22}\left(Z_{11}+Z_{1}+Z_{2}\right)-Z_{21}\left(Z_{12}+Z_{2}\right)}\right] V_{\text {out }} \tag{137}
\end{equation*}
$$

## An FET Example

Figure 5 shows a 950 MHz MESFET oscillator circuit configuration [1] and the analytical approach for optimum operating conditions for maximum oscillator output power. The analysis is based on a quasi-linear approach and is experimentally supported with the conversion efficiency of $54 \%$, which is the maximum conversion efficiency published for
this topology. However, the publication does not give any emphasis on the optimum phase noise, which is the key parameter for the oscillator design.

Power optimization of a GaAs-950MHz-MESFET oscillator [1]:

Figure 5 A 950 MHz MESFET oscillator circuit configuration.
The derivations of the analytical expressions are based on the open loop model of the oscillator. Figure 6 shows an equivalent circuit of the oscillator.

Figure 6 An equivalent circuit of the open model MESFET oscillator.
$Z_{1}$ can be expressed as

$$
\begin{equation*}
Z_{1}=\frac{\left[R_{i}+\frac{1}{j \omega C_{g s}}\right] \frac{1}{j \omega C_{1}}}{\left[R_{i}+\frac{1}{j \omega C_{g s}}+\frac{1}{j \omega C_{1}}\right]}=\frac{-\left[\frac{j R_{i}}{\omega C_{1}}+\frac{1}{\omega^{2} C_{g s} C_{1}}\right]}{\left[R_{i}-j\left(\frac{1}{\omega C_{g s}}+\frac{1}{\omega C_{1}}\right)\right]} \tag{138}
\end{equation*}
$$

Multiplying the numerator and the denominator by the conjugate yields:

$$
\begin{equation*}
Z_{1}=\frac{\left[\frac{-j R_{i}^{2}}{\omega C_{1}}-\frac{R_{i}}{\omega^{2} C_{g s} C_{1}}\right]+\frac{R_{i}}{\omega^{2} C_{1}}\left[\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right]-\frac{j}{\omega^{3} C_{g s} C_{1}}\left[\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right]}{\left[R_{i}^{2}+\left(\frac{1}{\omega C_{g s}}+\frac{1}{\omega C_{1}}\right)^{2}\right]} \tag{139}
\end{equation*}
$$

The following assumptions are made for simplification purposes.

$$
\begin{align*}
& \frac{R_{i}}{\omega^{2} C_{g s} C_{1}} \ll \frac{R_{i}}{\omega^{2} C_{1}}\left[\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right]  \tag{140}\\
& \frac{j R_{i}^{2}}{\omega C_{1}} \ll \frac{j}{\omega^{3} C_{g s} C_{1}}\left[\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right]  \tag{141}\\
& R_{i} \ll\left[\frac{1}{\omega C_{g s}}+\frac{1}{\omega C_{1}}\right] \tag{142}
\end{align*}
$$

then modified $Z_{1}$ can be represented as

$$
\begin{equation*}
Z_{1}=\left[\frac{\frac{R_{i}}{\omega^{2} C_{1}}\left(\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right)-\frac{j}{\omega^{3} C_{g s} C_{1}}\left(\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right)}{\left(\frac{1}{\omega C_{g s}}+\frac{1}{\omega C_{1}}\right)^{2}}\right] \tag{143}
\end{equation*}
$$

$$
\begin{equation*}
Z_{1}=\left[\frac{\left(\frac{R_{i}}{C_{1}}\right)}{\left(\frac{1}{C_{1}}+\frac{1}{C_{g s}}\right)}-\left(\frac{j}{\omega\left[C_{1}+C_{g s}\right]}\right)\right] \tag{144}
\end{equation*}
$$

defining the three new variables as

$$
\begin{align*}
& C_{a}=C_{1}+C_{g s}  \tag{145}\\
& C_{b}=C_{2}+C_{d s}  \tag{146}\\
& R_{a}=R_{s}+\frac{C_{g s}^{2}}{C_{a}^{2}} R_{i}  \tag{147}\\
& X_{a}=\omega L_{s}-\frac{1}{\omega C_{a}}  \tag{148}\\
& \omega\left(X_{a}=0\right)=\frac{1}{\sqrt{L_{s} C_{a}}} \tag{149}
\end{align*}
$$

Figure 7 shows a simplified open loop model of the oscillator for easy analysis. In this open loop model, the parasitic elements of the device are absorbed into the corresponding embedding impedances.

Figure 7 A simplified loop model of the oscillator.

$$
\begin{equation*}
Z=R_{a}+\frac{1}{j \omega C_{a}} \Rightarrow R_{s}+\frac{C_{g s}^{2}}{C_{a}^{2}} R_{i}-\frac{j}{\omega C_{a}} \tag{150}
\end{equation*}
$$

$$
\begin{gather*}
Z+j \omega L_{s}=R_{s}+\frac{C_{g s}^{2}}{C_{a}^{2}} R_{i}-\frac{j}{\omega C_{a}}+j \omega L_{s} \Rightarrow\left[R_{s}+\frac{C_{g s}^{2}}{C_{a}^{2}} R_{i}\right]+j\left[\omega L_{s}-\frac{1}{\omega C_{a}}\right]  \tag{151}\\
Z_{a}=Z+j \omega L_{s} \Rightarrow R_{a}+j X_{a}  \tag{152}\\
R_{a}=R_{s}+\frac{C_{g s}^{2}}{C_{a}^{2}} R_{i}  \tag{153}\\
X_{a}=\omega L_{s}-\frac{1}{\omega C_{a}}  \tag{154}\\
Z_{i}=Z_{a}\left\|C_{f} \Rightarrow\left[Z+j \omega L_{s}\right]\right\| C_{f}  \tag{155}\\
Z_{i}=\frac{-j\left[\frac{R_{a}+j X_{a}}{\omega C_{f}}\right]}{\left[R_{a}+j X_{a}-\frac{j}{\omega C_{f}}\right]} \Rightarrow \frac{\left[R_{a}+j X_{a}\right]}{\left[1+j R_{a} \omega C_{f}-\omega C_{f} X_{a}\right]}=\frac{\left[R_{a}+j X_{a}\right]}{1+j \omega C_{f}\left[R_{a}+j X_{a}\right]} \tag{156}
\end{gather*}
$$

The circuit model of the oscillator is shown in Figure 8, in which the output current through $Z_{\mathrm{L}}$ is given as

$$
\begin{equation*}
I=\frac{I_{d s}}{1+j \omega C_{b}\left[Z_{i}+Z_{L}\right]} \tag{157}
\end{equation*}
$$

Figure 8 A circuit model of an oscillator.

The voltage across $Z_{\mathrm{i}}$ is given as:

$$
\begin{equation*}
V_{z i}=I Z_{i}=-I_{d s}\left[\frac{\left[R_{a}+j X_{a}\right]}{1+j \omega C_{f}\left[R_{a}+j X_{a}\right]}\right]\left[\frac{1}{1+j \omega C_{b}\left[Z_{i}+Z_{L}\right]}\right] \tag{158}
\end{equation*}
$$

Applying the voltage divider in Figure 8, $V_{\mathrm{gs}}$ can be expressed as

$$
\begin{equation*}
V_{g s}=-I_{d s}\left[\frac{1}{j \omega C_{b}\left[R_{a}+j X_{a}\right]}\right]\left[\frac{Z_{i}}{1+j \omega C_{b}\left[Z_{i}+Z_{L}\right]}\right] \tag{159}
\end{equation*}
$$

Steady-state oscillation occurs when $I_{\mathrm{ds}}(\mathrm{t})=I_{\mathrm{I}}$ and $V_{\mathrm{gs}}=V_{\mathrm{p}}$. Consequently, the equation above can be written as

$$
\begin{gather*}
1+j \omega C_{b}\left[Z_{i}+Z_{L}\right]=-\frac{I_{d s}}{V_{g s}} \frac{Z_{i}}{j \omega C_{a}\left(R_{a}+j X_{a}\right)}  \tag{160}\\
1+j \omega C_{b}\left[Z_{i}+Z_{L}\right]=\frac{-g_{m c} Z_{i}}{j \omega C_{a}\left(R_{a}+j X_{a}\right)} \Rightarrow \frac{-g_{m c}\left[R_{a}+j X_{a}\right]}{j \omega C_{a}\left(R_{a}+j X_{a}\right)\left[1+j \omega C_{f}\left(R_{a}+j X_{a}\right)\right]}  \tag{161}\\
1+\mathrm{j} \omega \mathrm{C}_{\mathrm{b}}\left[\mathrm{Z}_{\mathrm{i}}+\mathrm{Z}_{\mathrm{L}}\right]=\frac{-\mathrm{g}_{\mathrm{mc}}}{\mathrm{j} \omega \mathrm{C}_{\mathrm{a}}\left[1+\mathrm{jwC}_{\mathrm{f}}\left(\mathrm{R}_{\mathrm{a}}+\mathrm{j} \mathrm{X}_{\mathrm{a}}\right)\right]}=\frac{\mathrm{g}_{\mathrm{mc}}}{\omega^{2} \mathrm{C}_{\mathrm{f}} \mathrm{C}_{\mathrm{a}}-\mathrm{j}\left[\omega \mathrm{C}_{\mathrm{a}}-\omega^{2} \mathrm{C}_{\mathrm{f}} \mathrm{C}_{\mathrm{a}} \mathrm{X}_{\mathrm{a}}\right]}  \tag{162}\\
Z_{L}=\frac{\mathrm{Z}_{\mathrm{L}}=\mathrm{Z}_{\mathrm{i}} \frac{\mathrm{~g}_{\mathrm{mc}}}{\omega^{2} \mathrm{C}_{\mathrm{b}} \mathrm{C}_{\mathrm{a}}\left[\mathrm{R}_{\mathrm{a}}+\mathrm{j} \mathrm{X}_{\mathrm{a}}\right]}-\mathrm{Z}_{\mathrm{i}}-\frac{1}{\mathrm{j} \omega \mathrm{C}_{\mathrm{b}}}}{\left[1+j \omega C_{f}\left(R_{a}+j X_{a}\right)\right]\left[\omega^{2} C_{b} C_{a}\left(R_{a}+j X_{a}\right)\right]}-\frac{\left(R_{a}+j X_{a}\right)}{\left[1+j \omega C_{f}\left(R_{a}+j X_{a}\right)\right]}-\frac{1}{j \omega C_{b}}  \tag{163}\\
Z_{L}=\frac{g_{m c}\left(R_{a}+j X_{a}\right)}{\omega^{2} C_{b} C_{a}\left[1+j \omega C_{f}\left(R_{a}+j X_{a}\right)\right]}-\frac{\left(R_{a}+j X_{a}\right)}{\left[1+j \omega C_{f}\left(R_{a}+j X_{a}\right)\right]}-\frac{1}{j \omega C_{b}} \tag{164}
\end{gather*}
$$

where

$$
\begin{equation*}
g_{m c}=\frac{I_{1}}{V_{p}}=\frac{I_{\max }}{2 V_{p}} \tag{166}
\end{equation*}
$$

In addition, $V_{\mathrm{ds}}$ can be determined by calculating $I_{\mathrm{cb}}$, the current through $C_{\mathrm{b}}$ with the help of Figure 8.

$$
\begin{equation*}
I_{c b}=I_{d s} \frac{\left[Z_{L}+Z_{i}\right]}{Z_{L}+Z_{i}+1 / j \omega C_{b}} \tag{167}
\end{equation*}
$$

Based on the last result we can conclude that

$$
\begin{equation*}
V_{d s}=I_{c b} \frac{j}{\omega C_{b}}=\frac{\left[Z_{L}+Z_{i}\right]}{Z_{L}+Z_{i}+1 / j \omega C_{b}} I_{1} \tag{168}
\end{equation*}
$$

or in squared magnitude form

$$
\begin{equation*}
V_{d s}^{2}=\frac{\left[Z_{L}+Z_{i}\right]^{2}}{\left[1+j \omega C_{b}\left(Z_{L}+Z_{i}\right)\right]^{2}} I_{1}^{2} \tag{169}
\end{equation*}
$$

Also, $\operatorname{Re}\left[Z_{\mathrm{L}}\right]$ can be defined as follows

$$
\begin{align*}
& \operatorname{Re}\left[Z_{L}\right]=\frac{g_{m c}\left[1-\omega C_{f} X_{a}-j \omega C_{f} R_{a}\right]}{\omega^{2} C_{b} C_{a}\left[\left(1-\omega C_{f} X_{a}\right)^{2}+\omega^{2} C_{f}^{2} R_{a}^{2}\right]}-\frac{\left(R_{a}+j X_{a}\right)\left[1-\omega C_{f} X_{a}-j \omega C_{f} R_{a}\right]}{\left[\left(1-\omega C_{f} X_{a}\right)^{2}+\omega^{2} C_{f}^{2} R_{a}^{2}\right]}  \tag{170}\\
& \operatorname{Re}\left[Z_{L}\right]=\frac{g_{m c}\left[1-\omega C_{f} X_{a}-j \omega C_{f} R_{a}\right]-\omega^{2} C_{b} C_{a}\left(R_{a}+j X_{a}\right)\left[1-\omega C_{f} X_{a}-j \omega C_{f} R_{a}\right]}{\omega^{2} C_{b} C_{a}\left[\left(1-\omega C_{f} X_{a}\right)^{2}+\omega^{2} C_{f}^{2} R_{a}^{2}\right]}  \tag{171}\\
& \operatorname{Re}\left[Z_{L}\right]=\frac{\left.g_{m c}\left[1-\omega C_{f} X_{a}\right]-\omega^{2} C_{b} C_{a} R_{a}+\omega^{3} C_{b} C_{a} C_{f} X_{a}-\omega^{3} C_{b} C_{a} C_{f} R_{a}\right)}{\omega^{2} C_{b} C_{a}\left[\left(1-\omega C_{f} X_{a}\right)^{2}+\omega^{2} C_{f}^{2} R_{a}^{2}\right]} \tag{172}
\end{align*}
$$

The power delivered to the load $Z_{\mathrm{L}}$ and the magnitude of $V_{\mathrm{ds}}$ can be determined by

$$
\begin{gather*}
P_{\text {out }}=\frac{1}{2} I^{2} \operatorname{Re}\left[Z_{L}\right]  \tag{173}\\
P_{\text {out }}=\frac{1}{2} I_{1}^{2} \frac{\operatorname{Re}\left[Z_{L}\right]}{\left[1+j \omega C_{b}\left(Z_{L}+Z_{i}\right)\right]^{2}}  \tag{174}\\
V_{d s}^{2}=\frac{\left[Z_{L}+Z_{i}\right]^{2}}{\left[1+j \omega C_{b}\left(Z_{L}+Z_{i}\right)\right]^{2}} I_{1}^{2}  \tag{175}\\
{\left[1+j \omega C_{b}\left(Z_{i}+Z_{L}\right)\right]^{2}=\frac{g_{m c}^{2}}{\left[\omega^{2} C_{f} C_{a} R_{a}-j\left(\omega C_{a}-\omega^{2} C_{f} C_{a} X_{a}\right)\right]\left[\omega^{2} C_{f} C_{a} R_{a}+j\left(\omega C_{a}-\omega^{2} C_{f} C_{a} X_{a}\right)\right]}} \tag{176}
\end{gather*}
$$

$$
\begin{equation*}
\left.1+j \omega C_{b}\left(Z_{i}+Z_{L}\right)\right]^{2}=\frac{g_{m c}^{2}}{\left(\omega^{2} C_{f} C_{a} R_{a}\right)^{2}+\left(\omega C_{a}-\omega^{2} C_{f} C_{a} X_{a}\right)^{2}}=\frac{g_{m c}^{2}}{\omega^{2} C_{a}^{2}\left[\left(1-\omega^{2} C_{f} C_{a} X_{a}\right)^{2}+\left(\omega^{2} C_{f} C_{a} R_{a}\right)^{2}\right.} \tag{177}
\end{equation*}
$$

Based on the equations above, the output power can be estimated as

$$
\begin{gather*}
P_{\text {out }}=\frac{1}{2} I^{2} \operatorname{Re}\left[Z_{L}\right]  \tag{178}\\
P_{\text {out }}=\frac{1}{2} I_{1}^{2} \frac{\operatorname{Re}\left[Z_{L}\right]}{\left[1+j \omega C_{b}\left(Z_{L}+Z_{i}\right)\right]^{2}}  \tag{179}\\
\frac{1}{2} I_{1}^{2} \frac{\left\{\frac{\left.g_{m c}\left[1-\omega C_{f} X_{a}\right]-\omega^{2} C_{b} C_{a} R_{a}+\omega^{3} C_{b} C_{a} C_{f} X_{a}-\omega^{3} C_{b} C_{a} C_{f} R_{a}\right)}{\omega^{2} C_{b} C_{a}\left[\left(1-\omega C_{f} X_{a}\right)^{2}+\omega^{2} C_{f}^{2} R_{a}^{2}\right]}\right\}}{\left\{\frac{g_{m c}^{2}}{\omega^{2} C_{a}^{2}\left[\left(1-\omega^{2} C_{f} C_{a} X_{a}\right)^{2}+\left(\omega^{2} C_{f} C_{a} R_{a}\right)^{2}\right.}\right\}}  \tag{180}\\
P_{\text {out }}=\frac{1}{2} I_{1}^{2} C_{a} \frac{\left.\left[1-\omega C_{f} X_{a}\right]-\omega^{2} C_{b} C_{a} R_{a}+\omega^{3} C_{b} C_{a} C_{f} X_{a}-\omega^{3} C_{b} C_{a} C_{f} R_{a}\right)}{g_{m c} C_{b}} \tag{181}
\end{gather*}
$$

Below 5 GHz , it is valid to ignore some of the terms by assuming that

$$
\begin{align*}
& \omega^{2} C_{b} C_{a} R_{a} \gg \omega^{3} C_{b} C_{a} C_{f} X_{a}  \tag{182}\\
& \omega^{2} C_{b} C_{a} R_{a} \gg \omega^{3} C_{b} C_{a} C_{f} R_{a} \tag{183}
\end{align*}
$$

The power output is now expressed as

$$
\begin{align*}
& P_{\text {out }}=\frac{1}{2} I_{1}^{2} C_{a} \frac{\left.g_{m c}\left[1-\omega C_{f} X_{a}\right]-\omega^{2} C_{b} C_{a} C_{f} R_{a}\right)}{g_{m c}^{2} C_{b}}  \tag{184}\\
& P_{\text {out }}=\frac{1}{2} I_{1}^{2}\left[C_{a} w \frac{\left[1-\omega C_{f} X_{a}\right]}{\omega C_{b}}-\frac{\omega^{2} C_{a}^{2} R_{a}}{g_{m c}^{2}}\right]  \tag{185}\\
& P_{\text {out }}=\frac{1}{2} I_{1}^{2}\left[\alpha \frac{\left[1-\omega C_{f} X_{a}\right]}{\omega C_{b}}-\alpha^{2} R_{a}\right] \tag{186}
\end{align*}
$$

$$
\begin{equation*}
\alpha=\frac{\omega C_{a}}{g_{m c}} \tag{187}
\end{equation*}
$$

In a similar manner, $V_{\mathrm{ds}}$ is given by

$$
\begin{equation*}
V_{d s}^{2}=I_{1}^{2}\left[\frac{\alpha^{2}\left[1-\omega C_{f} X_{a}\right]^{2}+\left[1-\omega C_{f} R_{a}\right]^{2}}{\omega^{2} C_{b}^{2}}\right] \tag{188}
\end{equation*}
$$

Both the output power and $V_{\mathrm{ds}}$ depend on $C_{\mathrm{b}}$ if the other parameters are fixed.
This is a limitation for the maximum value. However, a maximum value of the current and the voltage a transistor can take before burn-out. Therefore, by setting $\left|V_{\mathrm{ds}}\right|=V_{\mathrm{dsm}}$ an optimal condition can be given by [1]:

$$
\begin{equation*}
\frac{\left|V_{d s}\right|^{2}}{I_{1}^{2}}=\frac{\left|V_{d s m}\right|^{2}}{I_{1}^{2}}=\frac{\alpha^{2}\left[1-\omega C_{f} X_{a}\right]^{2}+\left[1-\omega C_{f} R_{a}\right]^{2}}{\omega^{2} C_{b}^{2}} \tag{189}
\end{equation*}
$$

The optimum load impedance that the device needs to see to deliver the highest power is defined as

$$
\begin{equation*}
\frac{\left|V_{d s}\right|}{I_{1}}=\frac{2\left|V_{d s m}\right|}{I_{\max }}=R_{o p t} \tag{190}
\end{equation*}
$$

leading to the following definition

$$
\begin{equation*}
\omega C_{b} R_{o p t}=\sqrt{\alpha^{2}\left[1-\omega C_{f} X_{a}\right]^{2}+\left[1-\omega C_{f} R_{a}\right]^{2}} \tag{191}
\end{equation*}
$$

Using the result above, the optimum $\mathrm{P}_{\text {out }}$ is, therefore, given by

$$
\begin{equation*}
P_{o u t}=\frac{V_{d s m} I_{d s m}}{4} \alpha \frac{\left[1-\omega C_{f} X_{a}\right]}{\sqrt{\alpha^{2}\left[1-\omega C_{f} X_{a}\right]^{2}+\left[1-\omega C_{f} R_{a}\right]^{2}}}-\left(\omega C_{a} V_{p}\right)^{2} \frac{R_{a}}{2} \tag{192}
\end{equation*}
$$

The first term is the power available from the current source and the second term is the power absorbed by $R_{\mathrm{a}}$. This also indicates that a high Q inductor minimizes the absorbed power, increasing the power available from the current source. $P_{\text {out }}$ simplifies further at the oscillation frequency since $X_{\mathrm{a}} \approx 0$.

$$
\begin{equation*}
P_{\text {out }}=\frac{V_{d s m} I_{d s m}}{4} \alpha \frac{1}{\sqrt{\alpha^{2}+\left[1-\alpha \omega C_{f} R_{a}\right]^{2}}}-\left(\omega C_{a} V_{p}\right)^{2} \frac{R_{a}}{2} \tag{193}
\end{equation*}
$$

The above analytical analysis gives the following important results:

1) Maximum output power is attained if we set

$$
\begin{equation*}
C_{f}=\frac{1}{\alpha \omega R_{a}} \tag{194}
\end{equation*}
$$

and

$$
\begin{align*}
& P_{o u t}(\max )=\frac{V_{d s m} I_{\max }}{4}\left[1-\frac{1}{G}\right]  \tag{195}\\
& \frac{1}{G}=\frac{P_{f}}{P_{a v}}=\omega^{2} C_{a}^{2} R_{a} \frac{2 V_{p}^{2}}{V_{d s m} I_{\max }} \tag{196}
\end{align*}
$$

Accordingly, the DC/RF conversion efficiency is calculated by

$$
\begin{align*}
& P_{d c}=\frac{V_{D S} I_{\max }}{\pi}  \tag{197}\\
& \eta_{\max }=\frac{P_{o u t}(\max )}{P_{d c}}  \tag{198}\\
& \eta_{\max }=\left[1-\frac{1}{G}\right] \frac{V_{d s m}}{V_{D S}} \tag{199}
\end{align*}
$$

In order to maximize the oscillator output power and efficiency, the loss resistance $R_{\mathrm{a}}$ of the input circuit has to be reduced (increasing G), and an optimal biasing condition $V_{\mathrm{DS}}$ has to be selected.
2)

$$
\begin{align*}
& C_{b}=\frac{\left[1-\omega C_{f} R_{a}\right] C_{a}}{g_{m c} R_{o p t}}  \tag{200}\\
& C_{b}\left(C_{f}=0\right)=\frac{C_{a}}{g_{m c} R_{o p t}} \tag{201}
\end{align*}
$$

3) Combining the above equation leads to expressions for $Z_{L}$ in terms of

$$
\begin{equation*}
Z_{L}=\frac{1+j \alpha}{1+\alpha^{2}} R_{o p t} \tag{202}
\end{equation*}
$$

From these analytical calculations, the following results were achieved. The circuit simulation of the oscillator done was using a nonlinear Materka model.

Figure 9 Schematic diagram of the oscillator operating at 950 MHz as published in [1].
Figure 9 above shows the schematic diagram of a practical oscillator operating at 950 MHz . A simple high-pass filter consisting of $L_{\mathrm{T}}$ and $C_{\mathrm{T}}$ is used to transfer the $Z_{0} / 50 \Omega$ load to the required $Z_{L}$ value.

From above expression all the effective components of the oscillator can be given as:

1. Bias condition:

$$
\begin{aligned}
& V_{D S}=5 \mathrm{~V} \\
& I_{D S}=18 \mathrm{~mA}
\end{aligned}
$$

2. Device Parameters:

$$
\begin{aligned}
& I_{\max }=45 \mathrm{~mA} \\
& V_{P}=1.25 \mathrm{~V} \\
& V_{K}(\text { knee }- \text { voltage })=0.5 \mathrm{~V}
\end{aligned}
$$

3. Device Parasitic:

$$
\begin{aligned}
& C_{g s}=0.5 p F \\
& C_{d s}=0.2 p F
\end{aligned}
$$

$$
C_{g d}=0.0089 p F
$$

4. Oscillator Parameters:

$$
\begin{aligned}
& \omega=\frac{1}{\sqrt{L_{s} C_{a}}} \Rightarrow f=950 \mathrm{MHz} \\
& C_{1}=6 p f \\
& C_{2}=1.5 p f \\
& C_{f}=20 p F \\
& L_{s}=3.9 n H \\
& C_{a}=C_{1}+C_{g s}=6.5 p F \\
& C_{b}=C_{2}+C_{d s}=1.7 p F \\
& L_{f}^{\prime}=18 n H \\
& C_{f}^{\prime}=15 p F \\
& R_{a}=R_{s}+\frac{C_{g s}^{2}}{C_{a}^{2}} R_{i}=4 \Omega
\end{aligned}
$$

5. Output matching circuit:
$L_{d}($ package $)=0.7 n H$
$L_{T}=8.9 n H$
$L_{T}^{\prime}=8.9 n H-L_{d}=8.7 n H$
$C_{T}=1.91 p F$
6. Calculation of $\mathrm{R}_{\mathrm{opt}}$ :

$$
\begin{aligned}
& I_{d c}=\frac{I_{\max }}{\pi} \\
& I_{1}=\frac{I_{\max }}{2}=22.5 \mathrm{~mA} \\
& R_{o p t}=\frac{V_{d s m}}{I_{1}}=\frac{V_{D S}-V_{K}}{I_{1}}=\frac{5 \mathrm{~V}-0.5 \mathrm{~V}}{22.5 \mathrm{~mA}}=200 \Omega
\end{aligned}
$$

7. Calculation of $\mathrm{Z}_{\mathrm{L}}$ :

$$
\begin{aligned}
& Z_{L}=\frac{1+j \alpha}{1+\alpha^{2}} R_{\text {opt }} \\
& g_{m c}=\frac{I_{1}}{V_{p}}=\frac{I_{\max }}{2 V_{p}}=\frac{45 \mathrm{~mA}}{2 * 1.25}=18.8 \mathrm{mS} \\
& \alpha=\frac{w_{0} C_{a}}{g_{m c}}=\frac{2 * \pi * 950 E+6 * 6.5 E-12}{0.0188}=2.0 \\
& Z_{L}=\frac{1+j \alpha}{1+\alpha^{2}} R_{\text {opt }}=\frac{1+j 2}{1+4} * 200=40+j 80 \Omega
\end{aligned}
$$

8. Output power:

$$
\begin{aligned}
& P_{\text {out }}(\max )=\frac{V_{d s m} I_{\max }}{4}\left[1-\frac{1}{G}\right]=16.6 d B m \\
& \frac{1}{G}=\frac{P_{f}}{P_{a v}}=\omega^{2} C_{a}^{2} R_{a} \frac{2 V_{p}^{2}}{V_{d s m} I_{\max }}
\end{aligned}
$$

9. DC-RF conversion efficiency:

$$
\begin{aligned}
& P_{d c}=\frac{V_{D S} I_{\max }}{\pi}=\frac{5 * 45 \mathrm{~mA}}{\pi}=71.62 \mathrm{~mW} \\
& \eta_{\max }=\frac{P_{o u t}(\mathrm{max})}{P_{d c}}=\frac{45.7 \mathrm{~mW}}{71.62 \mathrm{~mW}}=0.64 \\
& \eta_{\max }=64 \%
\end{aligned}
$$

## Simulated Results

Figures $10,11,12,13,14$, and 15 show the oscillator test circuit and its simulated results. After the oscillator circuit is analyzed in the harmonic-balance program, the oscillator frequency is found to be 1.08 GHz , and some tuning is required to bring the oscillator frequency back to the required value by changing $L_{\mathrm{s}}$ from 3.9 nH to 4.45 nH . The slight shift in the oscillator frequency may be due to the device parasitic. The simulated power output is 17.04 dBm , which is about the same as the measured value by [1]. The DC to RF conversion efficiency at the fundamental frequency is $55 \%$. The calculation in [1], as well as the calculation here, assumes an ideal transistor. By finding a better value between $C_{1}$ and $C_{2}$, the efficiency was increased to $64 \%$, compared to the published result of $55 \%$. This means that the circuit in [1] has not been fully optimized.

Figure 10 Schematic of the test oscillator based on [1].

Figure 11 Load line of the oscillator shown in Figure 10. Because the load is a tuned circuit, the "load line" is a curve and not a straight line.

Figure 12 Plot of drain current and drain source voltage as a function of time.

Figure 13 AC drain current simulated for Figure 10.

Figure 14 Simulated noise figure of the circuit shown in Figure 10. An increase of the feedback capacitor from 15 to 22 pF improves the phase noise.

Figure 15 Simulated output power of the oscillator shown in Figure 10.

Taking the published experimental results [1] into consideration, the analytical expression gives excellent insight into the performance of the oscillator circuit.

The maximum achievable output power and efficiency for a given active device can be predicted through the closed-form expressions without the need of a large-signal device characterization and an HB-simulation. The publication [1] has not addressed the power optimization and best phase noise, which is a very important requirement for the oscillator. By proper selection of the feedback ratio at the optimum drive level, the noise is improved by 8 dB , keeping the output power approximately the same. In [2] we discuss fixing the optimum feedback ratio and the absolute values of the feedback capacitor, with consideration for the best possible phase noise.
